(57) **ABSTRACT**

A clearance groove for receiving a bend in a flexible liquid
crystal display panel that is formed by folding a liquid
crystal display panel mounting member is provided near the
folding portion of the liquid crystal display panel mounting
member, by which the bend is received in the clearance
groove with a sufficient curvature when the liquid crystal
display panel mounting member is folded; hence, it is
possible to prevent the bend from damage and degradation
even if the bending frequency of the flexible liquid crystal
display panel increases.
